

Actual Amplitude = PAM value								
Normalized PAM Values = (Actual Amplitude / Level Height)								
Quantization Value = Approximate Adjacent Middle Value of Quantization Level								
Normalized Quantized Values = (Quantization Value / Level Height)								
Normalized Error = Normalized Quantized Values - Normalized PAM Values								
Quantization Code								
Encoded Bit								
Lowest Amplitude = $V_{\min}$								
Highest Amplitude = $V_{\max}$								
Number of Levels = L								
Level Height (Delta) = Δ								
Number of Bits in One Level = $\text{Log}_2(\text{Levels}) = n_b$								
Levels								
Level Mid Points = Sum of Adjacent two levels / 2								
Bit
